

AI Adoption Enablement

Practical support for turning scattered AI usage into a trusted, shared organizational asset

with INBAL GILEAD

Why AI Adoption Doesn't Scale

AI adoption is happening from the bottom up. individual people, then pockets of teams, each building their own workflows, tools, and context.

**Local progress matters,
but fragmentation creates drag.**

When AI usage is not treated as an operating shift, it can increase local speed without making the organization clearer or more capable.

**The real challenge is turning usage
into an asset.**

Scattered efforts need to become a trusted, shared organizational asset

Where I Come In

**I complement and empower the people
already on your team.**

I help them understand where AI can create real leverage, and what needs to change for that leverage to hold.

I bring patterns from adjacent disciplines.

Product, data, platform engineering, and battle-tested cross-functional execution, adapted to the team's context

The goal is forward motion with trust.

Helping teams move from scattered AI activity to a clearer, shared way of working.

About Me

I've spent nearly twenty years working inside complex product, data, and engineering orgs, where the hard part is rarely just the technology.

I help teams turn ambiguity into clear direction, practical execution, and real impact.

How I Support AI Adoption

1 Strategic Plan Define what AI should help the organization achieve

- Define what success looks like
- Identify the workflows, decisions, or capabilities worth changing first
- Turn the direction into a focused roadmap for the next phase of adoption

2 Embedded Support Implementation across real teams and workflows

- Work with leaders and teams as the plan moves into execution
- Connect team-level changes to the wider organization, so adoption does not stay isolated
- Define routines, skills, review points, and operating habits
- Create feedback loops that show what works, adjust what doesn't, and keep improving

3 Training Sessions Build targeted learning around real work

- Design expert sessions around the team's actual needs
- Turn learning into reusable assets for the team's real use cases

4 Partner Network Bring in trusted partners when needed

- Keep one coherent plan instead of disconnected activities
- Expand the support around the team without losing context, ownership, or direction
- Bring in the right specialist for the areas that matter most, so the team gets both a broad view and deep expertise where it counts

What might this look like for your team? Let's talk.
